The image shows a map of Southeast Asia with numerous colored markers indicating specimen locations. An inset window displays a photograph of a spiny eel specimen, labeled 'RLIKU09440, IL15-0096 [Mastacembelus oatesii]'. The eel is dark brown with a lighter belly and is positioned next to a color calibration chart. The map includes labels for various countries and regions such as China, India, Thailand, Vietnam, and the Philippines.

### Abstract

**Introduction**

**Materials and Methods**

**Results**

**Discussion**

**Supporting Information**

**Acknowledgments**

**Author Contributions**

Both hydropower dams and global warming pose threats to freshwater fish diversity. While the extent of global warming may be reduced by a shift towards energy generation by large dams in order to reduce fossil-fuel use, such dams profoundly modify riverine habitats. Furthermore, the threats posed by dams and global warming will interact: for example, dams constrain range adjustments by fishes that might compensate for warming temperatures. Evaluation of their combined or synergistic effects is thus essential for adequate assessment of the consequences of planned water-resource developments. We made projections of the responses of 363 fish species within the
